(Supplementary File)

WITNESS: A lightweight and practical approach to fine-grained predictive mutation testing

ZEYU LU, State Key Laboratory for Novel Software Technology, Nanjing University, China

PENG ZHANG, University of Luxembourg, Luxembourg

CHUN YONG CHONG, Huawei Technologies Co., Ltd., China

SHAN GAO, Independent Researcher, China

YIBIAO YANG, YANHUI LI, LIN CHEN, YUMING ZHOU, State Key Laboratory for Novel Software Technology, Nanjing University, China

This document serves as the supplementary file for the paper titled "WITNESS: A lightweight and practical approach to fine-grained predictive mutation testing." Section 1 presents the project version along with the sizes of the training, validation, and test sets for experiments conducted under the same-version, cross-version, and cross-project scenarios. Section 2 presents the results of comparisons with PMT.

CCS Concepts: • Software and its engineering → Software testing and debugging.

Additional Key Words and Phrases: Mutation Testing, Machine Learning, Kill Matrix, Test Case Prioritization

ACM Reference Format:

1 DATASET

We present the project version along with the sizes of the training set, validation set, and test set for experiments conducted under the same-version, cross-version, and cross-project scenarios. The values in Tables 1 through 8 represent mutant-test pairs. Tables 1, 2, 3, and 4 show the details of experiments conducted on mutant-test pairs where mutations occur inside source methods. Meanwhile, Tables 5, 6, 7, and 8 provide information on experiments conducted on all mutant-test pairs, including mutations occurring both inside and outside source methods.

Table 9. Average Predictive Performance of PMT and WITNESS

2 COMPARISON WITH PMT

As PMT [1] is a coarse-grained predictive mutation testing approach, we compare it in terms of mutant killing prediction (the overall killing results of each mutant by the entire test suite) and mutation score prediction. Since PMT is suitable for predicting mutants occurring outside source methods, we compare PMT and WITNESS on all mutants. The experimental setup and evaluation metrics align with those described in our paper.

Table 9 presents the average predictive performance of PMT and WITNESS in mutant killing prediction and mutation score prediction. Better values in Table 9 are highlighted in bold. Clearly, WITNESS outperforms PMT across all evaluation metrics. The comparison results of Seshat indicate that Seshat outperforms PMT. Since the results in our study show that WITNESS outperforms Seshat, WITNESS is expected to outperform PMT as well.
